

## ESTIMATED PRICE REPORT FOR FUELS

### **Relevant information**

One of Enap's main functions is to market different hydrocarbon derivatives with distribution companies, which autonomously set the final sales price to their clients.

Enap does not set or regulate fuel prices in the Chilean market. Consequently, this report cannot, in any case, consider that Enap determines, sets or defines references or values for prices to the final consumer, which are free given the condition of an open and competitive market.

This estimated price report is released every Wednesday.

The price estimate considers, among others, the following background information:

- Import prices of products from a close and deep reference market (United States Gulf Coast) and other costs inherent to the fuel import activity (for example: the cost of maritime transportation to Chile).
- The operating rules of the Fuel Price Stabilization Mechanism (MEPCO).
- The operating rules of the Oil Price Stabilization Fund (FEPP).

### **Price estimate**

Thus, for this week, the estimated variation in fuel prices is:

- 0.0 pesos per liter (\$/lt) in the price of 93 octane gasoline and 0.0 \$/lt in the price of 97 octane gasoline.
- +0.5 \$/lt in the case of kerosene.
- 0.0 \$/lt in the price of diesel.
- 0.0 \$/lt in the price of LPG for vehicular use.
